No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                 Score

Agonists of this response antagonize early stages of virulence, specifically production of cell wall proteins (so are preferred for prophylaxis), while antagonists interfere with the later stages of virulence, specifically secretion of exotoxin (so are preferred for treatment). The peptides are used to treat or prevent bacterial infections in humans and animals, also for incorporation into medical articles, e.g tampons (to prevent toxic shock syndrome), prosthesses and wound dressings. Particularly they are active against staphylococci, specifically Staphylococcus aureus but also congulase-negative S. epidermidis, implicated in infection of medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Affas ZM,

The invention relates to AgrD derived peptides, a composition containing a peptide and a carrier and a method for the production of the cyclic peptides. The peptide inhibits the agr response, which is normally associated with the release of virulence factors of Staphylococcus aureus. An AgrD peptide is produced by S. aureus that activates the agr response in strains of a single group, but interferes with this response in strains of different groups. The peptides and composition containing them can be used to treat infections by S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New cyclic

The present sequence is that of a novel synthetic cyclic peptide of the invention that is capable of inhibiting the agr response of Staphylococcus aureus. It is an AgrD-autoinducing peptide, where AgrD is a secreted agr-encoded peptide and where the agr locus controls the synthesis of virulence factor and other extracellular proteins responsible for pathogenicity in S. aureus. Preferred peptides may have the sequence NH2-X(n)-Z-X(y)-COOH, with a cyclic bond between the Z residue and COOH other than a thioester bond, where X is an amino acid, an amino acid analogue, a peptidomimetic or non-amide isostere, Z is a synthetic or a biosynthetic amino acid, n is 0-10 and y is 1-10. The cyclic bond is especially a lactam or lactone bond. The thiololactone
                                                                                                                                                                                                                                                                                                                                    Novel synthetic, interference and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibacterial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       structure within native AgrD peptides is required for activation of the agr response. Elimination of the thiol ester component of the cyclic ring structure can destroy agr response activating activity while preserving and enhancing inhibitory activity. A claimed method of preparing a cyclic peptide involves: assembling a linear peptide chain on to a solid phase resin support; deprotecting the resulting protected assembled peptide; treating to deprotected peptide with neutral buffer for a time sufficient to form the cyclic peptide and cleave the peptide from the support; and recovering the cyclic peptide. The peptide is useful for pacterial interference, especially for the treatment of S. aureus
                                                                                    The peptide was isolated from Fusinus perplex ferruginaus neuroganglia and inhibits muscular contraction, especially of the radular tractile muscle in F.perplex ferrugineus, Prosobranchia and other Mollusca. Alternatively, it can be synthesised by solidand other Mollusca. One or both of the Ser residues at positions 1 or phase techniques. One or both of the Ser residues at positions 1 or 2 may be absent. The peptide can be used in biological studies for the development of drugs. See also AAR10516-R10518 and AAR10520.
                                                                                                                                                                                                                                         Muscular contraction-inhibitory neuro-peptide(s) in mollusca

F۷,

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules such as ferritin

51; Page 56; 156pp; English

This sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one conjugate is capable of competing effectively with the analyte of the surrogate is capable of competing effectively with the analyte of the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogate is capable of compete effectively and with the analyte for a limiting amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. Functional surrogates are able to mimic naturally cocurring analytes. They can be labelled for use in standard competitive markers, elegen, homogenous immunoassays) for detecting large marromolecules such as polypeptides, polysaccharides, polynuclectides, glycoproteins and lipid-containing macromolecules, as well as small captogens. Typical diagnostic analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human considered to consider a sample assays are useful actogen, hepatitis antigens or antibodies against them, human considered to consider a sample and them are provided hormone, human procental lactogen, hepatitis antigens or antibodies against them, human considered to consider a sample and the sample and to consider a sample and the

(CYTO-) CYTOGEN CORP

Lee-owen F۷ Carter

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules such as ferritin $% \left(1\right) =\left\{ 1\right\} =\left$

Claim 51; 26; 156pp; English

This sequence represents a synthetic ferritin peptide which was used as functional surrogate in the conjugate of the invention. The novel capabiled conjugate comparises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an capabile of capabile of capabile for the analyte of that is altered upon interaction with the affinity receptor and this capabile. Functional surrogates such as this have an immunoreactive group that allows the surrogates such as this have an immunoreactive canalyte for a limiting amount of its affinity receptor. Punctional surrogates are able to mimic naturally occurring analytes. They can be labelled for use in standard compete effectively and with the canalyte for a bit to mimic naturally occurring analytes. They can be labelled for use in standard compete effectively assays (esp. copypeptides, polymorphic surface), polymorphic surfaces such as glycoproteins and copypeptides, polymorphic such as glycoproteins and copypeptides, polymorphic such as surfaces and control of the same and copypeptides, polymorphic such as glycoproteins and control of the same and copypeptides. polypeptides, polysaccharides, lipid-containing macromolecule macromolecules, as well as small

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnostic analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human luteinising hormone, cytomegalovirus, Chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcincembryonic antigen, alpha-fetoprotein, prosteate-specific antigen and CA125 (a tumour marker).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a synthetic ferritin peptide which was used as collabelled comjugate on the conjugate of the invention. The novel call labelled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an caffinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this cativity can be measured and related to the amount of the analyte present in a sample. Functional surrogate is such as this have an immunoreactive group that allows the surrogate co-compete effectively and with the canned the surrogate are able to mimic naturally occurring analytes. They can be labelled for use in standard competitive affinity receptor. Functional competence of the sasays (esp. composed the sample of the surrogate co-compete effectively and with the conjugate are able to mimic naturally occurring analytes. They can be labelled for use in standard competitive affinity assays (esp. composed the sample of the surrogate co-competitive affinity assays (esp. complete the sample of the surrogate co-competitive affinity assays (esp. complete the sample of the surrogate co-competitive affinity assays and complete the surrogate containing macromolecules, as well as small haptens. Typical caspointed with infectious disease. In particular, the assays are completed to fertility-pregnancy or analytes are consisted with infectious disease. In particular, the assays are consisted with infectious disease. In particular, the assays are consisted with infectious disease. In particular, the assays are consisted with infectious disease. In particular, the assays are consisted with infectious disease. In particular, the assays are consisted with infectious disease. In particular, the assays them, human consisted with a surrogate in the surrogate is consisted with a surrogate is consisted with a surrogate is consisted with a surrogate is

This sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs consumed that the conjugate of the invention. The novel labelled conjugate comprises at least one comparises at least one comparises at least one conjugate exhibits an activity that is altered upon interaction with the analyte conjugate exhibits an activity that is altered upon interaction with conjugate exhibits an activity that is altered upon interaction with comparise this have an immunoreactive group that allows the surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for use in standard competitive affinity receptor. Functional surrogates are able to mimic naturally occurring analytes. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunoassays) for detecting large containing macromolecules, as well as small containing macromolecules, as well as small containing macromolecules as well as small containing macromolecules. Typical diagnostic analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or canalytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human containing containing hormone, human containing containing hormone, which human containing hormone, cytomegalovirus, of containing hormone, cytomegalovirus, containing hormone, cytomegalovirus, cont

                                                                                                                                                                                                                                                                                                                                                                       CC conjugate exhibits an activity that is altered upon interaction with CC the affinity receptor and this activity can be measured and related to CC the amount of the analyte present in a sample. Functional surrogates CC such as this have an immunoreactive group that allows the surrogate to CC compete effectively and with the analyte for a limiting amount of its CC affinity receptor. Functional surrogates are able to mimic naturally CC occurring analytes. They can be labelled for use in standard competitive CC affinity assays (esp. homogenous immunoassays) for detecting large CC macromolecules such as polypeptides, polypaccharides, polypucleotides, CC glycoproteins and lipid-containing macromolecules, as well as small CC tumour markers, allergens, hormones related to fertility-pregnancy or CC analytes associated with infectious disease. In particular, the assays CC are useful for detecting ferritin, follicle stimulating hormone, human CC placental lactogen, hepatitis antigens or antibodies against them, human CC chamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, CC myoglobin, myosin light chain, troponin, carcinoembryonic anatigen, CC climare for teaching the prostate-specific antigen and CA125 (a tumour marker). CC (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                         В
                                                                                                                                 RESULT 12
                                                                                                                                                                                                                                                                Query Match

Peptides containing motifs such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one label attached to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte for a limiting amount of an affinity receptor for the analyte. The

Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules such as ferritin $\,$

Claim 51; Page 56; 156pp; English

CC such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one Clabel attached to a functional surrogate of an analyte of interest. CC The surrogate is capable of competing effectively with the analyte CC for a limiting amount of an affinity receptor for the analyte. The CC conjugate exhibits an activity that is altered upon interaction with CC the affinity receptor and this activity can be measured and related to CC the amount of the analyte present in a sample. Functional surrogate s such as this have an immunoreactive group that allows the surrogates cc such as this have an immunoreactive group that allows the surrogate occurring analytes. They can be labelled for use in standard competitive concurring analytes. They can be labelled for use in standard competitive concurring analytes such as polypeptides, polysaccharides, polynucleotides, glycoproteins and lipid-containing macromolecules, as well as small cc macromolecules as well as small cc manufactory or can analytes associated with infectious disease. In particular, the assays care useful for detecting ferritin, follicle stimulating hormone, human cc placental lactogen, hepatitis antigens or antibodies against them, human contains, propaction, parachyroid hormone, human chorionic gonadotropin, human luteinising hormone, cytomegalovirus, composin light chain, tropolasma, herpes virus, DK-MB, cmyclotian, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, contained on 25-MAR-2003 to correct PI field.) This sequence represents a peptide motif derived from ferritin which important for selective binding affinity. Peptides containing motifs such as this may be used as functional surrogates in the conjugate of 18

RESULT 13
                                                                                                                                                                                                                                                                                                    This sequence represents a peptide motif derived from ferritin which is important for selective binding affinity. Peptides containing motifs such as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate comprises at least one the invention. The novel labelled conjugate comprises at least one conjugate is capable of competing effectively with the analyte for a limiting amount of an affinity receptor for the analyte. The conjugate exhibits an activity that is altered upon interaction with the affinity receptor and this activity can be measured and related to the amount of the analyte present in a sample. Functional surrogates such as this have an immunoreactive group that allows the surrogate to compete effectively and with the analyte for a limiting amount of its affinity receptor. Functional surrogates are able to mimic naturally occurring analytes. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunosassys) for detecting large
macromolecules such as polypeptides, polypeaccharides, polypuclectides, glycoproteins and lipid-containing macromolecules, as well as small haptens. Typical diagnostic analytes for detection include cardiac or tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human lutteinising hormone, cytomegalovirus, chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour marker). (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Functional surrogate; analyte; affinity receptor; immunoreactive group; mimic; homogenous immunoassay; detection; diagnostic analyte; Chlamydia; cardiac marker; tumour marker; allergen; hormone; fertility; myoglobin; pregnancy; infectious disease; ferritin; myosin light chain; troponin; follicle stimulating hormone; human; growth hormone; immunoglobulin E; prolactin; parathyroid hormone; placental lactogen; hepatitis antigen; antibody; chorionic gonadotropin; luteinising hormone; cytomegalovirus; streptococcus; rubella; toxoplasma; DK-MB; prostate-specific antigen; carcinoembryonic antigen; alpha-fetoprotein; herpes virus; CA125.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Labelled functional surrogate of an analyte - useful as competitor molecule in affinity assays, esp. for detecting large macromolecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SX
This sequence represents a peptide motif derived from ferritin which is comportant for selective binding affinity. Peptides containing motifs consuch as this may be used as functional surrogates in the conjugate of the invention. The novel labelled conjugate composises at least one compared to a functional surrogate of an analyte of interest. The surrogate is capable of competing effectively with the analyte conjugate exhibits an activity that is altered upon interaction with conjugate exhibits an activity that is altered upon interaction with conjugate exhibits an activity that is altered upon interaction with conjugate exhibits an activity that is altered upon interaction with confidence in the analyte present in a sample. Punctional surrogates compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively and with the analyte for a limiting amount of its compete effectively analytes. They can be labelled for use in standard competitive affinity assays (esp. homogenous immunoassays) for detecting large macromolecules and lipid-containing macromolecules, as well as small containing macromolecules, as well as small containing macromolecules, as well as small contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention describes a method of producing soluble human leukocyte antigen (HLA) molecules (SHLA) in cell pharm involving amplifying HLA allelic DNA by PCR using a locus specific primer to produce truncated a PCR product (PI), inserting P1 into mammalian expression vector; electroporating the plasmid into a host cell; inoculating the cell pharm with the host cell such that cell pharm produces SHLA. A multimeric HLA complex (I) is useful for testing functionality of peptide ligands bound by at least two soluble HLA molecules. (I) can be tested for its ability to serve as ligands for cytotoxic T lymphocytes (CTLs) and induce immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour markers, allergens, hormones related to fertility-pregnancy or analytes associated with infectious disease. In particular, the assays are useful for detecting ferritin, follicle stimulating hormone, human growth hormone, immunoglobulin E, prolactin, parathyroid hormone, human placental lactogen, hepatitis antigens or antibodies against them, human chorionic gonadotropin, human lutteinising hormone, cytomegalovirus, Chlamydia, Streptococcus a, rubella, toxoplasma, herpes virus, DK-MB, myoglobin, myosin light chain, troponin, carcinoembryonic antigen, alpha-fetoprotein, prostate-specific antigen and CA125 (a tumour marker) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Soluble human leukocyte antigen; HLA; sHLA; cell pharm; multimeric HLA complex; cytotoxic T lymphocytes; CTL; immune response; viral infection; cancer; autoimmune disease; vaccine development; MHC; major histocompatibility complex; diagnostic development; HLA class I polymorphism; HLA-B15 allotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo

CC responses in humans. (I) is useful for studying T cell responses to pathological conditions such as viral infections and cancer, and for modulating the human immune system to induce tolerance in autoimmune cd. seases. The individual secreted major histocompatibility complex (MHC) molecules produced are useful for studies of peptide loading (i.e., in concine development) and to the development of diagnostics. With the secreted MHC molecules, naturally loaded peptides can be eluted from the CC secreted MHC molecules, naturally loaded peptides can be eluted from the casessment of structural and functional impact of HIA class I sessessment of structural and functional impact of HIA class I collars I HIA-BIS allotypes; compare the different ligand maps to cidentify potentially shared elements; and characterise the elements constitutely potentially shared elements; and characterise the elements constituted to positively or negatively validate the occurrence of commandian or insect/bacterial cells such that milligram or greater quantities of an individual class I or class I molecule can be obtained.

This sequence represents a HIA (human leukocyte antigen) epitope.
